

SUMMARY

Mid-level Flutter engineer who builds and maintains real, client-facing apps from start to finish, using Clean Architecture, BLoC/Cubit, Firebase, payment integration, and app releases. Able to own a front-end alone, from planning the architecture to publishing the app, and also works well in teams on shared design systems and cross-platform apps.

TECHNICAL EXPERIENCE

Mid-Level Flutter Developer at SND

03/2025 — current

Flutter Developer — Patient App & SND Doctors (Provider App)

- **Owned both SND Flutter apps front-end end-to-end:** Built and shipped the patient app (03/2025), then the companion SND Doctors provider app (08/2025) used by clinics, hospitals, labs and pharmacies, as the platform's sole front-end developer. Shared one Clean Architecture foundation (data, domain, features; BLoC/Cubit, GetIt, GoRouter) across both to keep delivery fast and the design system consistent. To cover SND's full two-sided healthcare marketplace – patients and providers – without a dedicated front-end team on either side.
- **Delivered patient-side core flows:** Subscription management, prescription and medical-record handling, service scheduling and reservations, a cashback/points system, and location-based discovery of clinics, labs, hospitals and pharmacies, on a Dio + Hive data layer with offline resilience, Syncfusion's PDF viewer and flutter_map/geolocator. To give patients one app to find care, manage their health records, and track rewards.
- **Delivered provider-side operations and shared infrastructure:** Institution and staff management, patient requests and reservations, scheduling and invoicing as independent BLoC-driven feature modules, plus fl_chart analytics dashboards and showcaseview onboarding for providers. Backed both apps with shared payment (Paymob), security (biometric login, flutter_secure_storage), release (Shorebird OTA updates) and full Arabic/English localization infrastructure. To let providers run their side of the platform while both apps ship fixes safely and serve both languages.

Flutter Developer at Slash

07/2024 — 12/2024

Intern → Flutter Developer

- **Refactored the Slash seller app into Clean Architecture:** Restructured the codebase into independent layers (data, domain, presentation) alongside the team, improving modularity and making the app easier to extend and test. To reduce technical debt and support faster feature delivery going forward.
- **Built a web version of the main app:** Adapted the existing Flutter mobile app for the browser using Flutter Web, keeping behavior and design consistent across platforms. To reach users who preferred browsing on desktop instead of installing the app.
- **Led a UI modernization and theming overhaul:** Rebuilt the app's UI on a new design system with full light/dark theme support, working closely with the design team on responsive layouts and reusable components. To bring the interface up to date and make future UI work faster and more consistent.
- **Raised code quality through testing and review:** Wrote unit tests to catch regressions early and took an active role in code reviews, pushing for consistent patterns across the codebase. To keep the app stable and maintainable as the team grew.

SKILLS

Tools and Languages: Dart, Flutter Development, Flutter Web, Flutter Bloc, MVVM Architecture, Clean Architecture, GoRouter, GetIt (DI), Dio, Hive, Firebase, Payment Gateway Integration, Kotlin, Android Development, Android Jetpack Compose, Android-Retrofit | Room

PROJECTS

LPB — Loyalty Platform

08/2026 — current

Founder Project

- **Architected a multi-tenant loyalty platform from scratch:** Designed and built a wallet-pass-first loyalty system as a single Flutter codebase serving three separate apps – staff, client dashboard, and admin panel – routed with go_router. Backed it with Supabase Postgres, enforcing every access rule through Row-Level Security instead of client-side checks, so the database itself is the security boundary. To let branch staff, business managers and platform admins share one system without any risk of one client seeing another's data.
- **Built the wallet-pass loyalty loop:** Implemented Apple/Google Wallet card issuing, QR/barcode capture at the point of sale, and an offline capture queue for the staff app, with Supabase Edge Functions keeping wallet cards in sync with loyalty state. Used Riverpod's AsyncNotifier to drive loading, data and error states consistently across the app. To let a cashier scan a customer's wallet card and log a visit or reward in seconds, even offline on unreliable shop wifi.
- **Shipped dashboards and proved the security model with tests:** Built analytics dashboards for client managers, an admin panel for onboarding new client businesses, and a public customer registration page, then backed the multi-tenant security model with a dedicated RLS policy test suite alongside Flutter unit/widget tests. Deployed the platform to a live demo environment. To validate that the tenant isolation holds before a first real client is onboarded. not after.

Pet Care Application

12/2023 — current

Personal Project

- **Architected scalable application structure:** Implemented MVVM architectural pattern with clear separation of concerns between data, business logic, and presentation layers. Utilized dependency injection for better testability and maintainability. To establish a clean, maintainable codebase that follows industry best practices. Integrated firebase as the backend to manage user authentication and data storage efficiently.
- **Developed comprehensive UI system:** Created a library of reusable custom widgets with support for both light and dark themes. Implemented responsive layouts using Flutter's advanced UI capabilities and custom animations. To ensure consistent user experience across different devices and theme preferences.
- **Implemented robust state management:** Utilized Cubit pattern for efficient state management and data flow throughout the application. Created modular features with clear boundaries and responsibilities. To improve app performance, maintainability, and user experience while reducing potential bugs. Employed firebase for real-time data synchronization and state persistence.

Team Leader / Pocket Trainer

11/2022 — 06/2023

Graduation project

- **Developed AI-powered fitness application:** Led the development of a comprehensive fitness application integrating pose detection AI for real-time exercise form analysis. Utilized Flutter for mobile development and implemented backend services using Node.js. To provide accessible, professional-level fitness guidance and prevent workout-related injuries.
- **Implemented personalized recommendation system:** Designed and developed an intelligent system for generating customized exercise and nutrition plans based on user data and progress. Combined multiple technologies including Python for data processing and JavaScript for API integrations. To deliver tailored fitness solutions that adapt to individual user needs and goals.
- **Managed full-stack development workflow:** Coordinated development across mobile, backend, and AI components while leading team collaboration through GitHub. Integrated pose detection AI model with mobile application features for seamless user experience. To demonstrate practical application of AI technology in daily fitness routines while ensuring system reliability and performance.
- tools: dart, javaScript, nodeJs, flutter, pyhton,

EDUCATION

Bachelor of Software Engineering:

Faculty of Science / Alexandria University

09/2019 — 06/2023

Software Industry and Multimedia (Software Industry and Multimedia)

CGPA: 2.9

Grade: Good

CERTIFICATES

- Internship completion in flutter at Slash – Dive Deeper: Certificate October, 30, 2024
- The Complete 2022 Flutter & Dart Development Course – Dive Deeper: Certificate July, 21, 2023
- Flutter clean architecture(MVVM) – Dive Deeper: Certificate Oct, 14, 2023
- Kotlin –Dive Deeper: Certificate Oct, 7, 2023
